Sequence 5704, Application US/09621976

Patent No. 663963

GENERAL INFORMATION:

APPLICANT: Dumas Milne Edwards, J.B.

APPLICANT: Glordano, J.Y.

TITLE OF INVENTION: ESTS and Encoded Human Proteins.

FILE REFERENCE: GENSET: 054PR2

CURRENT APPLICATION NUMBER: US/09/621,976

CURRENT FILING DATE: 2000-07-21

NUMBER OF SEQ ID NOS: 19335

SOFTWARE: Patent.pm

LENGTH: 62

Patent No. 6699703
GENERAL INFORMATION:
A SPECIAL INFORMATION:
A TITLE OF INVENTION: Nucleic Acid and Amino Acid Sequences Relating to Streptococcus
TITLE OF INVENTION: Pneumoniae for Diagnostics and Therapeutics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The hormone of the invention demonstrates anorectic, antidiabetic, hypotensive, cardiant, antiarthritic, cytostatic, nephrotropic, hopatotropic, analgesic, cerebroprotective and uropathic activities. The method of the invention may be useful for treating obesity, type II albetes, cholelithisais, hyperension, coronary heart disease, atheroscierosis, types I to VI glycogenosis, arthritis, cancer, renal failure, liver disease, chronic pain, sleep apnea, stroke and urinary incontinence. The current sequence is that of the honeybee AKH peptide of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method of promoting lipid mobilisation in a human which comprises administering an insect adipokinetic hormone (AKH). The hormone of the invention demonstrates anorectic, antidiabetic, hypotensive, cardiant, antiathritic, cytostatic, nephrotropic, hepatotropic, analgesic, cerebroprotective and uropathic activities. The method of the invention may be useful for treating obesity, type II diabetes, cholelithiasis, hypertension, coronary heart disease, atherosclerosis, types I to VI glycogenosis, arthritis, cancer, renal failure, liver disease, chronic pain, sleep apnea, stroke and urinary incontinence. The current sequence is that of the painted lady AKH peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                              AAB86090
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel method for the detection of a mammalian infection by an acid-resistant microorganism (A) by treating a faecal sample with at least two different monoclonal antibodies (MAD) (or their fragments or derivatives) or aptamers (collectively (I)) and detecting formation of a complex (C) between (I) and the corresponding antigen of formation of a complex (C) between (I) and the corresponding antigen of (A). The first and second (I) bind to epitopes of different antigens (A). The first and second (I) bind to epitopes of different antigens (I) at least some mammals, and have either: (I) their native structure; or (II) a structure against which an antibody is produced by an animal infected or immunized with (A), or its extract, lysaed, derived protein or fragment, or with a synthetic peptide. Practically all mammals display at least one of the specified epitopes. The method is used to detect the fact one of the specified epitopes. The method is used to detect who by acid-fast bacteria, particularly of the genera Helicobacter, Mycobacterium and Campylobacter, specifically H pylori, H hepaticus, Mycobacterium and campylobacter, specifically H pylori, H hepaticus, Mycobacterium and campylobacter, and non-invasive, and provides an inexpensive and easily standardizable diagnosis, despite possible degradation of antigens during passage through the intestines. This sequence represents a fragment of a H pylori beta-urease-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting infection by acid-fast microbes for diagnosis of Helicobacter pylori, comprises reacting a fecal sample with two binding reagents for antigens that survive intestinal passage.
                                                                                                                                                                                                                                                                  Acid-resistant microorganism; detection; faecal; intestine; infection; monoclonal antibody; heavy chain; complementarity determining region;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antibody heavy chain complementarity determining region CDR1 which is used to illustrate the method of the invention
                                                                                                                                                                                                                       H. pylori beta-urease-binding antibody heavy chain CDR1 protein #2.

acid-resistent microorganism (A), in a mammal, using immortor properties of the method is used to diagnose infection by an acid resistant microorganism (A), in a mammal, using immunochromatography. The method is used to diagnose infection by an acid campylobacter or Mycobacterium, particularly H. pylori (most preferred), H. hepatica, C. jejuni and M. tuberculosis. The method is rapid, simple, inexpensive and non-invasive, and may indicate the stage of infection. A test strip used in the method may include a filter to eliminate particle present in the sample and only a single receptor provides a reasonably secure diagnosis, with specificity and selectivity improved by detecting several epitopes (of catalase) or different antigens (catalase and betaurease). The method can be automated, This sequence represents a urease). The determining region (CDR) from an antibody raised against the H. pylori catalase or beta-urease antigen which is used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting infections by acid-resistant microorganisms, particularly for diagnosing Helicobacter pylori, comprises immunochromatographic detection of antigen in feces.
                                                                                                                               Catalase; beta-urease; antibody; antigen; detection; infection; epitop

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel method for detecting, in a mammal, infection by an acid-resistant microorganism (A) which comprises reacting a feecil sample with: (1) a receptor (R) such that a complex is formed with an antigen (A); or (i) two different R so that a three-part complex is formed with Ag, and the formation of a complex detected. R are specific for an Ag which, after passage through the intestines, at least in some mammals, retains a native (or corresponding) structure against which the mammal produces antibodies (when immunized or infected with synthetic peptides). The products of the invention have antibacterial activity. The method is used to diagnose infection by Helicobacter. Campylobacter or Mycobacterium, particularly H. pylori (most preferred). The progress of the undertolarly and also to monitor the progress of the treatment. Receptors, particularly and also to monitor the progress of the reatment of infections. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Also it is direct, noninvasive, suitable for automation and may indicate the stage of an infection. This sequence represents a complementarity determining region (CDR) from an antibody generated against a Helicobacter pylori antigen (catalase or beta-urease) which is used to illustrate the method of the

                                                                                                                                                                                                                                               The invention relates to a novel method of promoting lipid mobilisation in a human which comprises administering an insect adipokinetic hormone (AKH). The hormone of the invention demonstrates anorectic, antidiabetic, hypotensive, cardiant, antiatrhitic, cytostatic, nephrotropic, hepatotropic, analgesic, cerebroprotective and uropathic activities. The method of the invention may be useful for treating obesity, type II diabetes, cholelithiasis, hypertension, coronary heart disease, atherosclerosis, types I to VI glycogenosis, arthritis, cancer, renal failure, liver disease, chronic pain, sleep apnea, stroke and urinary incontinence. The current sequence is that of the painted lady AKH peptide 2 of the invention.
Pharmaceutical composition useful for promoting weight loss, comprises an insect adipokinetic hormone, having a pyroglutamate residue at its amino

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of obtaining a phage particle which has an antibody fragment directed against an antigen associated with the surface of target cells in a heterogeneous cell population. The method involves incubating a library of phage particles with the target cells to allow binding of the antibody fragment expressed on the surface of the phage particles to the antigen associated with the target cells. The method is useful for obtaining human antibodies against known and novel surface antigens in their native configuration, expressed on phenotypically defined subpoulations of cells. The phenotypically defined subpoulations of cells. The phenotypically defined subpoulations of cells. The present sequence is complementarity determining region 3 (CDR3) of monoclonal phage
                                                                                                                                                                                                                                                                                                             Obtaining a phage particle, useful for obtaining human antibodies against known and novel surface antigens, by incubating a phage library with

The invention discloses a method for obtaining a phage comprising an antibody, or its fragment, directed against antigens associated with a target cells surface in a heterogeneous cell population. The method comprises providing a library of antibodies, or their fragments, attibody library with the target cells, incubating the phage antibody library with the target cells, separating the phage cells and phage particles associated with the target cells, separating the phage particles or associated with the target cells and then recovering the phage particles. Also disclosed is a cell-type specific phage antibody, or antibody fragment, obtained using the method. The method is useful for obtaining a selection of phage antibodies (Phabs) and conclonal phage antibodies (Wobhabs). The method is also useful for detecting known and novel structures on various populations of blood and foetal bone marrow cells. The sequence presented is an example of the partly randomised human complementarity determining region 3 (CDR3) used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunosuppressive; immunostimulatory; antiinflammatory; cytostatic; neuroprotective; antimicrobial; gene therapy; vaccine; amylase; cancer; amyloid protein; angiopoietin; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histone; kinase; colony stimulating factor; complement related protein; cytochrome; kinesin; cytokine; interferon; interleukin; G-protein coupled receptor; thioesterase; inflammation; multifactorial disease; autoimmune disease; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Obtaining phage having antibody specific for cell surface antigen of target cells in heterogeneous cell population, by incubating phage antibody library with target cells, and separating phage particles bound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

AAR97871-R97960 are overlapping peptides used for the epitope mapping of the Japan cedar pollen allergen Cry j II. Cry j II and allergenic peptides of it are useful in the diagnosis, prevention and treatment of Sugi pollinosis, the allerger reaction to Japan cedar pollen. Significant regions of the allergen were identified using the overlapping peptidus of the full epitope derived from a Cry j II antigen-specific Teell line. Amino acids 66-80 (AAR97884) and 186-200 (R979908) of the full mature 460 amino acid allergen are the most allergenic of the 90 peptides tested
                                                                                                                                                                                                            AAR97871-R97960 are overlapping peptides used for the epitope mapping of the Japan cedar pollen allergen Cry j II.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to oligonucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, androgoiethin, apportosis related proteins, cacherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinasins, cytokines, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is a peptide encoded by them may be used in the prevention, diagnosis and the peptides encoded by them may be used in the prevented, diagnosis and treatment of diseases associated with in a genetic component, such as autoimmune diseases (e.g. rheumatoid arthitis, multiple sclerosis, diabetes, systemic lupus erythromatosus brain, breast, colon and Kidney, leukaemia), diseases of the nervous system and an infection of pathogenic organisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections.

                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents residues 16-30 of the Cry j 2 protein, and is a peptide of the invention. The peptides are derived from Japanese cedar pollen antigens, and are used as immunocherapeutic agents in the treatment of allergy. The peptides can be used for identification and typing of the particular HLA class II molecules in an allergy sufferer, and also for peptide immunotherapy of an allergy. Using these peptides the immunotherapy can be targeted more specifically to the requirements of the individual patient, allowing more effective treatment of an allergy, including those patiants for whom treatment with a conventional immunotherapeutic agent is ineffective
                                                                                                                                                                                                                                                                                                                                                                              immunotherapeutic agents - useful for allergy treatment and typing HLA class II molecules in allergy sufferers.

The compound that modulates the activity or expression of 22108 and 47916 nucleic acid is useful for treating or preventing a disorder characterised by aberrant activity of 22108 and 47916-expressing cell, specifically for reducing or inhibiting the aberrant activity of the 22108 and 47916-expressing cancer cell. The 22108 and 47916 nucleic acid and polypeptide are useful for diagnosing, preventing or treating cancer in a subject (e.g. carcinoma, sarcoma, metastactic or hematopoietic disorders (e.g. carcinoma, sarcoma, uniq, breast, thyroid, head neck, prostate or genito-urinary tract), cardiovascular diseases (e.g. angina pectoris, arteriosclerosis or heart disture) or brain disorders (e.g. brain abscess, meningitis, Alzheimer's diseases). The thioredoxin DNA is also useful in gene therapy. The present sequence is human thioredoxin, 47916 peptide
                               cancer; lung; breast, thyroid; head; neck; prostate; genitourinary tract; cardiovascular disease; angina pectoris; arteriosclerosis; heart failure; brain discase; meningitis; Alzheimer's disease; sarcoma; cytostatic; carcinoma; cardiant; neuroprotective; antiinflammatory; gene therapy; nootropic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New human thioredoxin nucleic acid and polypeptide molecules, designated 22108 and 47916, useful for diagnosing, preventing or treating cancer (e.g. carcinoma), cardiovascular diseases (e.g. heart failure) or brain
Human; thioredoxin; 22108; 47916; haematopoietic disorder; leukaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       T-cell epitope peptide 45 from Japanese cypress pollen antigen Chao2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

AGG PAG63005 represent complementarity determining region 3 (CDR3) of VL and VH chains of antibodies of the invention. The specification describes a mixture or panel of 5 different specific binding members, each comprising an antibody VH and/Or VL variable domain and capable, when displayed on the surface of filamentous bacteriophage particles or in the case of a specific binding member comprising the D5 VH and/or VL variable domain when bound to human serum amyloid protein, to pass through a mammalian blood brain barrier (BBB). The panel is useful for the selection of Specific binding members with a desired property such as a bility to cross BBB, ability to bind areas of inflammation in the brain or BBB cransferrin receptor. The antibodies are useful in diagnosis, prophylaxis and treatment of human or animal body, including neurological diseases, collaborated dementia, epilepsy and traumatic brain injury and any diseases involving inflammation occurring within the brain or central nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated or recombinant polypeptide for use in modulating a plant growth trait in a flowering plant e.g. in Arabidopsis, Brassica, Zea, or Oryza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        plant growth; plant growth trait modulation; Brassicaceae; Arabidopsis; Brassica; Zea; Oryza; Tritticum; Hordeum; Lolium; Sorghum; Glycine; Medicago; Helianthus; Lactuca; Beta; Vitis; Solanum; Lycoperation; Capaicum; Gossypium; Hevea; Linum; Prunus; Citrus; Populus; Pinus;
                                                   Mixture or panel of antibodies for selecting specific binding members that cross the blood brain barrier, for use in delivering different molecules and treating neurological diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..

                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a T-cell epitope peptide from Japanese cypress pollen antigen Chao2. The present invention describes peptides which correspond to the T-cell epitope sites on Japanese cypress pollen antigens Chao1 and Chao2. The peptides can be used as a reagent for the diagnosis of allergy to Japanese cypress pollen, and as an antigen in the transment and prevention of spring tree pollen disease in which the pollinosis involves reactivity to Japanese cypress pollen.                                                                                                                                                                                                                                              ò
                                                                                                                                                                               셤
                                                                                                                                                           ò
                                         the invention describes an instance of the perspective training the specification, or a conservative variant; (b) encoded by 1 of 30 sequences (S1), as given in the specification, or a conservative variant; (c) encoded by a sequence that hybridises under stringent conditions to S2; and (d) encoded by a sequence 70 % identical to S2. The expression or activity of (l) is modulated to modulate a plant growth trait in a flowering plant, of the family Brassicaceau, preferably in a plant that is Arabidopsis, Brassica, Zea, Oryza, Triticum, Hordeum, Lolium, Sorghum, Lycopersicon, Capsicum, Gossypium, Hevea, Linum, Portuns, Citrus, Populus, Pinus, or Quercus. A new method is used to detect genes for a plant growth trait. This is the amino acid sequence of region of ADE25056 used to demonstrate conservative substitutions occurring in the protein.
                                                                                                                                                                                                                                                                    ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to human single exon nucleic acid probes (SEMP: see AAILO068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are defived from human HeLa cells. The SENPs can be used to producel a single exon microarray, which can be used for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human genome-derived single exon nucleic acid probes useful for analyzing
epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formadirectly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to single exon nucleic acid probes (SENP: see AAI3135-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide #5114 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver. Comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG59930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from MIPO at (ftp. wipo.int/pub/published_pot_sequences)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                 Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia,
hypercholosterolaemia, coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         70.8%; Score 17; DB 4; Length 27; 40.0%; Pred. ```
The invention relates to a spatiality-addressation in a sample derived from human lung comprising single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid sequences mentioned in the specification, or their complements or the 1237 open reading frames derived from the 12614 to probes. Also included are a microarray comprising the novel set of probes withing hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample conflection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) array; identifying exons in a eukaryotic genome, comprising (a) array; identifying exons in the stone of detectably contacted acids from eukaryote lung mRNA, to a single exon probe, contacting a fragment identical to the profession of detectably contacted acids from eukaryote lung mRNA, to a single exon probe, contacting a fragment identical to the profession of each of the exons in the above mentioned microarray; assigning exons to a single exon probe, comprising (a) identifying exons from genomic sequence by the method in the above mentioned in the specification to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tisques and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tisques and/or cell types indicates the corposes of probes/open reading frames (ORP). The probes are used for gene expression canding frames (ORP). The probes are used for gene expression canding frames (ORP). The probes are used for gene expression canding frames (ORP). The probes is are used expression cander, chronic obst
                                                                                      Human peptide encoded by genome-derived single exon probe SEQ ID 30187.
                                                                                                                      chronic obstructive pulmonary disease; interstitial lung disease; chronic obstructive pulmonary disease; interstitial lung disease; familial idiopathic pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histicyctosis; lymphangioleiomyomicosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; primary ciliary dyskinesis; pulmonary hypertension;

The method involves reacting (T) with a HGBV polynuclectide probe (I) containing 15 contiguous nuclectides, and which detectinely hybridises to the HGBV genome or its full complement, and detecting the complex that contains THN, indicating the presence of target HGBV. The method is used for detecting target HGBV nucleic acid in the test sample suspected of containing HGBV and for characterisation of the HGBV accretained etiological agent of non-A, non-B, non-C, non-D and non-B hapatitis causing agents collectively termed as hepatitis GB virus.

protein genes, and AAG71243-AAG71319 represent the proteins they encode.

AAG7130-AAG71403 represent human secreted protein genes and their corresponding secreted proteins are useful fragments. The genes and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the S2 genes, based on the tissues in which they are most highly expressed, proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, albergies, neurological disorders, e.g., Alzheimer's disease, although sthmation, allergies, neurological disorders, e.g., Alzheimer's disease, parkinsons's disease), cognitive disorders, schizophrenia, asthma, skin

comprises producing in a cell comprising oil bodies a first and second comprises producing in a cell comprising oil bodies a first and second cerecombinant polyapeptide (Pi. P2), where Pi is capable of associating with P2 to form the MPC and associating the complex with an occlusion body complex the MPC and associating an oil body associated with a recombinant CC P1. M1 is useful for producing an oil body associated with a recombinant complex. The oil bodies are further formulated for use in the preparation of a food product such as milk or wheat based food product, personal care product which reduces the oxidative stress on the surface area of the cuman body or used to lighten the skin, or a pharmaceutical composition used to treat chronic obstructive pulmonary disease, (BCDP), cataracts, diabetes, envenomation, bronchiopulmonary disease, psoriasis, contestinal (GI) bleeding, intestinal bowel disease (IBD), ulcers, GBRD (Gastro ossophageal reflux disease). ABN09569 to ABN09593 and ABP60677 to ABR60964 represent sequence given in the exemplification of the present

          cardiovascular disorders, angiogenic disorders, kidney disorders, gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to unburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties.

Antibodiuu spacific for a protein of the invention can be used in diagnostic immunoassasy or si, radioimmunoassay or enzyme linked immunoassays e.g., radioimmunoassay or enzyme linked immunoaorbent assay (ELISA). The present sequence represents a human secreted protein fragment referred to in the disclosure of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acids equences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule

Producing oil body associated with recombinant multimeric protein comple e.g. rodox proteins and immunoglobulins comprises producing recombinant polypeptides capable of forming the complex in cells comprising oil bodies.

The present invention describes a method (M1) for producing an oil body

Claim 81; Page 248; 362pp; English.

expressed in human cells or tissues. Also included are a spatially-
addressable set of single exon nucleic acid probes for measuring human
compression (comprising a plurality of single exon nucleic acid
probes cited above, where each of the plurality of probes is separately
and addressably isolatable or amplifiable from the plurality), a single
exon microarray for measuring human gene expression, a method of
measuring human gene expression, a method of
measuring human gene expression, a vector comprising the single exon
probe cited above, an ORF-encoded peptide comprising the single exon
probe cited above, an ORF-encoded peptide comprising at least 8
contiguous amino acids of any of the above- mentioned amino acid
solated antibody that binds specifically to a peptide cited above,
methods of selling and/or licensing single exon probes or microarrays to
contiguous amino acids of measure gene expression, a method of providing
comman gene expression data by subscription, and a computer-readable
storage medium which contains a database having a plurality of records
contage medium which contains a database having a plurality of records
contend and probe, methods and apparatus are useful in gene
expression analysis. The probes and apparatus are useful in gene
contiguous to detect the prosence of expressed measages that contain their
specific exon, or in constructing genome-derived single exon microarrays.
In addition, the probes are used in identifying and characterising gross
alternations in the genomic locus that includes their includes their sequence is a human
contained in the genomic locus that includes their exon, in assessing
smaller genomic alterations, in priming the Synthesis of mucleic acids,
or in expressing the ORF-encoded peptide. The present sequence is a human

Polypeptides of G-coupled receptor proteins (GPRs) - useful for binding

```
Polypeptides AAR48768-81 and AAR50569-R50718 are based on the consensus transmembrane domain III sequence from G-protein coupled receptor (GPR) proteins, and can be used in G-protein coupled receptor ligand binding assays. The assay can be used to identify fragments pref. transmembrane fragments, from GPR proteins (see AAR48686-R48788 for examples) which retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see AAR48759-R48758, AAR50569-R50807 and AAR89189-R89195 for examples of polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polypeptides AAR48768-81 and AAR50569-R50718 are based on the consensus transmembrane domain III sequence from G-protein coupled receptor (GPR) proteins, and can be used in G-protein coupled receptor ligand binding assays. The assay can be used to identify fragments pref. transmembrane fragments, from GPR proteins (see AAR48686-R48758 for examples) which retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see AAR48759-R48758, AAR50569-R50807 and AAR89189-R89195 for examples of polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        G-protein coupled receptor; ligand binding assay; transmembrane domain; psychotic disorder; schizophrenia; dopamine; CAMP; adenosine; thrombin; muscarinic acetylcholine; adrenergic; endothelin; bombesin; endocrine; rhodopsin; opsin; odorant; cytomegalovirue; serotonergic.

Polypeptides AAW02747-W02910 are based on the consensus transmembrane domain III sequence from G-protein coupled receptor (GPR) proteins and can be used in GPR ligand binding assays. The assays can be used to identify fragments, pref. transmembrane fragments, from GPR proteins (see AAW02657-W02635) which retain biological activity such as binding a GPR ligand or modulating a GPR ligand binding to a GPR (see W02747-AAW0299) for examples of polypeptide fragments). The polypeptide fragments can be used in compsns. for treating subjects suffering from a pathology related to a GPR abnormality e.g. schizophrenia. (Updated on 25-WAR-2003 to

                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polypaptides AAW02747-W02910 are based on the consensus transmembrane domain III sequence from G-protein coupled receptor (GPR) proteins and can be used in GPR ligand binding assays. The assays can be used to identify fragments, pref. transmembrane fragments, from GPR proteins (see AAW02657-W02635) which retain biological activity such as binding a GPR ligand or modulating a GPR ligand binding to a GPR (see W02747-AAW0299) for examples of polypeptide fragments). The polypeptide fragments can be used in compans. for treating subjects suffering from a pathology related to a GPR abnormality e.g. schizophrenia. (Updated on 25-MAR-2003 to

Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                Allergenic Cry j II protein and fragments from Japanese cedar pollenused to diagnose, treat and prevent Japanese cedar pollinosis.
                                                                                                                                                                                   The sequence is of a Japanese cedar pollen allergen Cry j II fragment The protein and fragments can be used for diagnosis and treatment of Japanese cedar pollinosis and to identify similar sequences in other plants.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the encoded proteins (AA000000-AA01310) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymetedies are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammunomodulatory activity and activity, issue growth factor activity, immunomodulatory activity and activity, indiammation. Sometive of cancer, leukaemia, nervous system disorders, archritis and inflammation. Note: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                  Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human polynucleotides (AAI79941-AAI93841) and

proteins. The genes and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 97 genes, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and foetal afficiencies, blood disorders, diseases of the immune system, autoimmune diseases, inflammation, allergies, Alzheimer's and cognitive disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney disorders, diseases, infections and AIDS. The polypeptides are also useful for identifying their binding partners. The sequences shown in AAY76224 to AAY76424 represent fragments of the secreted proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

AAY76124 to AAY76223 are the secreted proteins encoded by the 97 human genes. This sequence represents a fragment of one of the human secreted
        treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                 The invention relates to human secreted polypeptides and the polynucleotides encoding them. The sequences are useful for preparing medicaments for preventing, treating or ameliorating medical conditions e.g., cancer, liver disorders such as hepatitis or neural disorders such as Alzheimer's disease. This sequence represents a human secreted polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Tumor necrosis factor receptor; TNF; T129 protein; TANGO 129; human; cellular process; immunological disorder; abnormal lymphoid development; thymic development; T-cell mediated immune response; humoral B cell; skeletal muscle disorder; drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides an isolated human tumor necrosis factor (TNF) receptor member, T129 (also referred as TANGO 129). The T129 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated tumor necrosis factor receptor member used to develop products for treating, e.g. immunological disorders or disorders of the skeletal muscle.
                                                                                                               New nucleic acid molecule, useful for preparing a medicament for preventing, treating or ameliorating a medical condition e.g. cancer, liver disorders or neural disorders.
                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21-JUL-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     30-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       19-JUL-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  19-JUL-1999
        can be expressed by standard recombinant methodology. The T219 polypeptides are useful, as modulating agents in regulating a variety of cellular processes. Agents or modulators which have a stimulatory or inhibitory effect on T129 activity (e.g. T129 gene expression) as identified by a screening assay can be administered to individuals to treat (prophylactically) or therapeutically) disorders, e.g., an immunological disorder associated with aberrant T129 activity, disorders associated with abnormal lymphoid and/or thymic development, T-cell mediated immune response, T-cell dependent help for B cells, and abnormal humoral B crivity, and possibly disorders of the skeletal muscle. The products can also be used for detection, diagnosis, drug screening and production of transgenic animals. The present sequence represents a TNFR/NGFR cysteine-rich domain of T129 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                   Peptide #11801 encoded by probe for measuring placental gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to single exon nucleic acid probes (SENP:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The polynucleotide sequences given in AAF33037 to AAF33085 encode the human secreted proteins given in AAB64666 to AAB64714. AAB64715 to AAB64717 represent human secreted polypeptide sequences and proteins convenient human secreted proteins have activities based on the tissues and cells the genes are expressed in Examples of activities include: cytostatic; antirheumatic; antiarthritic; dermalogical; cardiant; cantinflammatory; gastrointestinal; and anti-ulcer. The polymucleotides and polypeptides can be used in the prevention, treatment and diagnosis of diseases associated, with inappropriate polypeptide expression. Disorders that may be treated or prevented include solid tumours, conformatoid arthritis, psoriasis, diabetic retinopathy, myocardial angiogenesis, Crohn's disease and ulcers. The polymucleotides and their complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples, and therefore which patients may be in need of restorative therapy. The polypeptides contagonists of polypeptide expression and activity. The anti-polypeptide and antagonists and antagonists and antagonists and antagonists and antagonists and antagonists and activity. The anti-polypeptide and antagonists and antagonists and sequences used to down regulate expression and activity. AAF33028 to AAF33036 and AAB64665 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                   antiarthritic, dermalogical, cardiant, antiinflammatory, anti-ulcer, gastrointestinal, solid tumour, rheumatoid arthritis, psoriasis, diabetic retinopathy, myocardial angiogenesis, Crohn's disease, ulcer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding 49 human secreted polypeptides, useful for preventing, diagnosing and/or treating diseases such as tumors, rheumatoid arthritis, psoriasis and diabetic retinopathy.
                                                                                                                                                                                                                                       Human secreted protein sequence encoded by gene 36 SEQ ID NO:149.
                                                                                                                                                                                                                                                                                antirheumatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to oytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunoomodulatory activity and activity, tissue growth factor activity, immunoomodulatory activity and activity, inknibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                  gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzhaimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
              Human brain expressed single exon probe encoded protein SEQ ID NO: 36935.
                                              Human; brain exprossed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Examplo 4; SEQ ID NO 36935; 650pp + Sequence Listing; English.

A; Title: Purification and some properties of a Haim-sensitive alpha-amylase from newly is A; Accession: PH1380; MUID: 93113087; PMID: 1369074
A; Reference number: PH1380; MUID: 93113087; PMID: 1369074
A; Molecule type: protein
A; Residues: 1-20 «KAW»
A; Cross-references: UNIPROT: 09R5E8
A; Residues: 1-20 «KAW»
A; Cross-references: UNIPROT: 09R5E8
A; Experimental source: strain No. 195
C; Comment: This enzyme has an optimum pH of 7.0.
C; Comment: This enzyme has an optimum pH of 7.0.
C; Function: catalyzes the hydrolysis of internal 1,4-alpha-D-glucosidic bonds
A; Pathway: glycosidase; hydrolase; polysaccharide degradation
C; Keywords: glycosidase; hydrolase; polysaccharide degradation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 adipokinetic hormone - black horse fly
